

Shaniid RX — UI/UX Audit & Quality Assurance Report

Prepared by: Graphix team

Objective: High-priority frontend navigation and component layout corrections.

1. Broken Header Navigation & Page Anchor Glitch

- **The Problem:** When you tap the header menu to navigate (like clicking "Home" or "Shop"), the new page doesn't start at the top. Instead, it glitches and automatically jumps straight down to the footer or random sections in the middle of the page.
- **The Correction:** Implement a Scroll-to-Top function on page change. Whenever a user clicks any navigation link in the header, the new page must load seamlessly from the absolute top of the screen.

2. The Product Page Link (Eye Icon)

The Problem: The eye icon is completely broken. It is supposed to act as the gateway to the product page, but it doesn't take the user where they need to go.

The Correction: When a user taps the eye icon, it must immediately open the Product Detail Page. This page needs to show the full product breakdown with a gallery of 3-4 different photos showing every angle of the item.

3. The Cart Dropdown & Double "X" Bug

The Problem: Tapping the cart creates a massive, oversized layout that takes over the entire page. Even worse, it has two "X" close icons inside it, which looks unprofessional and confuses the user.

The Correction: Fix the layout width so it doesn't take over the whole screen. Remove one of the "X" icons immediately so there is only one clear way to close it.

4. Empty Cart Typography & Huge Gaps

The Problem: When the cart is empty, the text layout ("Start shopping," "Sign in," "Create an account") looks completely off. The text size is massive, and there is a huge, awkward vertical gap between the lines.

The Correction: Reduce the text sizes to a clean, standard scale and fix the alignment so the spacing looks tight and professional.

MEDIUM PRIORITY (Visual Consistency & Alignment)

5. Header Icon Sizing (Account, Wishlist, Cart)

The Problem: The Account, Wishlist, and Cart icons are all different sizes and shapes right now, which breaks the visual balance of the header.

The Correction: Match the sizes of all three of these components exactly. They must have the same width, height, and tap target size.

6. "Add to Cart" Button Layout & Grid Alignment

The Problem: The product grid looks messy because the "Add to Cart" boxes are not aligned. Some are sitting high, some are in the middle, and some are lower down.

The Correction: Align all "Add to Cart" buttons perfectly on the same horizontal line across the entire product catalog page.

7. Broken Hover States & Redundant Icons

The Problem: Some "Add to Cart" buttons change color when you hover over them, but others stay completely static. Also, the button has a redundant +  graphic that clutters the design.

The Correction: * Make the hover behavior identical across all buttons (normal color standard, changing to the hover color only when tapped/hovered).

Remove one of the duplicate cart icons inside the button text to clean up the UI.

8. UI Aesthetic Mismatch: Sign-Up & Login Pages

The Problem: The design of the Sign-Up and Login pages completely ignores the Figma specifications. The developer built standard flat pages instead of implementing the required glassmorphism aesthetic, breaking the premium visual identity of the platform.

The Correction: Update the styling container for the auth forms to use true glassmorphism.
